Examples of the disorders involving degradation of the extracellular matrix include cardiovascular diseases e.g. heart failure and atherosclerosis, arthritis, nephritis, neurological disease, periodontal disease, skin ulceration, liver fibrosis, emphysema, fibrotic lung disease, secreta and viral infections, wound healing, chronic injury, acute disorder (autoimmune disorder), traumatic, ischaemia, psoriasis, aberrant angiogenesis and tissue invasion and metastasis by tumour cells. This the amino acid sequence of the long form of the novel human matrix metalloproteinase 46798 described in the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequence 520 AA;

(I) and the polypucleotide encoding it (II) are useful for evaluating the efficacy of a treatment of a disorder. (I) is useful as novel diagnostic target and therapeutic agent for prognosticating, diagnosting, preventing, inhibiting, alleviating or prognosticating, diagnosing, where (I) functions in normal tissues to feel the treatment of the prognostication of the prognosticati

                                                                                                                              The present invention relates to the isolation of novel human matrix metalloproteinases (MWP), designated 46798, and the polynucleotide sequences encoding them. The MMP 46798 polypeptide and polynucleotide sequences are useful for disgnossing, preventing, alleviating or treating metalloproteinase-associated disorders such as cell proliferation and/or differentiation disorders (e.g. carcinoma, sercoma, leukaemia, breast cancer, or lung cancer), neurological disorders (e.g. schizophrenia, ischaemia, infarction, parkinson's disease or Huntington's disease), inflammatory disorders (e.g. Crohn's disease), immune disorders (e.g. disbetes mellitus or arthritis), cardiovascular disorders (e.g. chronic bronchitis, pulmonary congestion or rheumatic heart disease), motility disorders, developmental disorders, lung disorders (e.g. chronic bronchitis, pulmonary congestion or oedema), and blood/blood clotting disorders. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           breast cancer; lung cancer; neurological disorder; schizophrenia; ischaemia; infarction; Parkinson's disease; Huntington's disease; inflammatory disorder; Crohn's disease; immune disorder; arthritis; diabetes mellitus; cardiovascular disorder; restenosis; tachycardia; rheumatic heart disease; motility disorder; developmental disorder; lung disorder; chronic bronchitis; pulmonary congestion; oedema; lood disorder; blood clotting disorder; cytostatic; immunomodulator; anti-inflammatory; cardiant; antiparkinsonian; nootropic; thrombolytic;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New human matrix metalloproteinase nucleic acid and polypeptide molecules, designated 46798, useful for diagnosing, preventing or treating cancers, ischemia, Parkinson's disease heart disease or or the control of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Claim 17; Page 113-114; 117pp; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           16-JAN-2001; 2001US-0262252P

                                                                                                                                                                The invention describes an isolated nucleic acid (I) comprising, or which CC has 80 % sequence identity to, or the full-length coding sequence of, one CC of 275 nuclectide sequences, and which encodes a corresponding CC polypeptide selected from 275 amino acid sequences, where all sequences are given in the specification. The polypeptide encoded by (I) is used to detect PRO polypeptides, link a bloactive molecule to a cell expressing a CC PRO polypeptide, modulate a biological activity of a cell, stimulate the CC release of tumour necrosis factor (TNP)-alpha from human blood, modulate the uptake of glucose or free facty acid by cells, stimulate the release of proteoglycans, stimulate the release of cytokine CC stimulate the release of proteoglycans, stimulate the release of cytokine CC factor VIIA, or detect the presence of tumour in a mammal. The nucleic cid and polypeptide encoded by it, are useful for treating inflammatory birth defects, premature aging, acquired immunodeficiency syndrome CC (AIDS), cancer, or diabetic complications. The nucleic acid is useful as the solosensors or bioreactors. Both are useful as pharmaceuticals, composities, biosensors or bioreactors. Both are useful in tissue typing. This is the amino acid sequence of a novel human secreted and

                                                                                                                                                                                                                                                                                                                       The present invention relates to the isolation of novel human PRO polypeptides, and the polynucleotide sequences encoding them. The PRO polypeptides are secreted and transmembrane proteins. The PRO polypeptides and polynucleotides are useful for preparing a medicament useful in the treatment of diabetes, bone and/or cartilage disorders (e.g. rheumatoid arthritis, sports injuries, osteoarthritis), obesity, hyper- or hypo-insulinaemia, hearing loss, and coagulation disorders (e.g. stroke, heart attack). Anti-PRO antibodies are useful in diagnostic serum, and for affinity purification of PRO from recombinant cell culture or natural sources. ABU80870-ABU80114 represent the human PRO polypeptides of the invention. Note: The sequence data for this patent was obtained in electronic format directly from the USPTO web site at sequata.uspto.gov/psipsDIDEntry.html

The PRO CC polypeptides are secreted and transmembrane proteins. The PRO CC polypeptides are useful for detecting other PRO polypeptides, for linking CC biological activities of cells expressing PRO polypeptides, for modulating thing agonists or antagonists. The PRO polypeptides, and for for CC identifying agonists or antagonists. The PRO polypeptides are useful for CC for stimulating the release of tumour necrosis factor (TNF)-alpha from CC thuman blood, for stimulating the proliferation or differentiation of CC chondrocytes, and detecting the proliferation or differentiation of CC condrocytes, and detecting the presence of tumours. The polymucleotide CC sequences encoding PRO polypeptides are useful as hybridisation probes, in the greparation of PRO polypeptides, for generation franspenic CC animals or knockout animals, for the generation analysis of individuals with CC genetic disorders, and in gene therapy. ABU66570-ABU66844 represent the human PRO polypeptides of the invention. Note: The sequence data for this cat segdata.uspto.gov/psipsDIDEntry.html
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Query Match

       The invention describes an isolated human PRO polypeptide. The PRO polypeptides are useful in detecting PRO polypeptides in a sample, in linking a bioactive molecule to a cell expressing a PRO polypeptide, and in modulating at least one biological activity of a cell expressing a PRO polypeptide. PRO1312 stimulates hypertrophy of neonatal heart and is thus useful for treating cardiac insufficiency disorders. PRO154 and PRO1186
                                                                                                                                                                                                              Two hundred and seventy five nucleic acids encoding

New isolated nucleic acid encoding a PRO polypeptide, e.g. PRO1114 PRO4978, useful in molecular biology, chromosome and gene mapping, generating antisense RNA and DNA, and in gene therapy. in

Fig 144; 659pp; English.

The invention relates to an isolated nucleic acid comprising at least 80% sequence identity to a PRO (secreted and transmembrane protein) cDNA comprising a nucleic acid (a) encoding a PRO polypeptide, or its extracellular domain (with or without its associated signal peptide), which comprises any of the 275 120-850 residue amino acid sequences, given in the specification; (b) comprising any of the 275 300-3500 nucleotide sequences, given in the specification; or (c) comprising the full-length coding sequence of the nucleotide sequence given in the specification, or of the DNA deposited under any of the American Type Culture Collection (ATCC) Accession Numbers listed in the specification. Also included are a vector comprising the novel nucleic acid, a host cell producing a PRO

```
The invention relates to an isolated nucleic acid comprising, or which is at least 80% identical to, or the full-length coding sequence of, any of the 275 nucleotide sequences, encoding the corresponding PRO polypeptide (one of 275 secreted or transmembrane proteins). The nucleic acid further comprises the full-length coding sequence of the DNA deposited under American Type Culture Collection (ATCC) accession number in a list given in the specification. Also included are vectors and host cells for
                                                                                                                                                                                                                                                                                                                                    02-MAR-2000

Novel secreted and transmembrane polypeptide for modulating biological activity of cell expressing the polypeptide, identifying agonists or antagonists of polypeptide, and as molecular weight markers.

Claim Fig 144; 659pp; English.

The invention describes 305 nucleic acids encoding PRO (secreted and transmembrane) polypeptides (I). (I) is useful for stimulating the release of TNF-alpha from human blood, for modulating the uptake of glucose or PFA by skeletal muscle cells or adipocyte cells, for stimulating the proliferation or differentiation of chondrocyte cells, for stimulating the proliferation of or gene expression in pericyte cells, for stimulating the release of proteoglycans from cartilage, for stimulating the proliferation of inner ear utricular supporting cells, for stimulating the proliferation of Tlymphocyte cells, for stimulating the proliferation of Tlymphocyte cells, for stimulating the proliferation of Tlymphocyte cells, for stimulating the binding of the release of a cytokine from PBMC cells, for inhibiting the binding of A-peptide to factor VIIA, for inhibiting the differentiation of adipocyte

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             cells, for stimulating proliferation of endothelial cells, for detecting the presence of tumour in a mammal. The tumour is lung, colon, breast, crostate, rectal, cervical or liver tumour. The oligonucleotide probes are useful for isolating genomic and cDNA nucleotide sequences or contisense probes. (I) is also useful as therapeutic agent pro is useful in assays to identify other proteins or molecules involved in binding colon assays to identify other proteins or molecules involved in binding colon assays to identify other proteins or molecules involved in binding colon dentify in generation of antisense RNA and DNA, in the comparation of PRO polypeptide, for generating transgenic animals or knockout animals which in turn are useful in the development and contromosome identification, as chromosome marker, and for generating concess. An anti-(I)-antibody is useful in diagnostic assays for PRO, e.g. detecting its expression in specific cells, tissues or serum, and for caffinity purification of PRO from recombinant cell culture or natural color sources. (I) and (II) are useful for tissue typing. This is the amino colon of the company of the amino action of a novel human secreted and transmembrane PRO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Query Match

The invention relates to isolated human PRO polypeptides (secreted and transmembrane polypeptides) and the polynucleotides encoding them. The invention also relates to an antibody which specifically binds to a PRO polypeptide, a method for stimulating the release of tumour necrosis factor-slpha (TNF-slpha) from human blood, a method for stimulating the proliferation or differentiation of chondrocyte cells and a method for detecting the presence of a tumour in a mammal (e.g. adrenal, lung, colon, breast, prostate, rectal, kidney, cervical and liver tumours). The polymucleotides are useful in molecular biology, including uses as hybridisation probes, in chromosome and gene mapping, in generating antisense RNA and DNA and in gene therapy. The polymucleotides may also be used in preparing PRO polypeptides by recombinant techniques and in generating either transgenic animals or knock-out animals which are
                                                                                                                                                                                                                                                                                                                                                       Claim
                                                                                                                                                                                                                                                                                                                                                                                                 New isolated nucleic acid encoding a secreted and transmembrane polypeptide, designated e.g. PRO1114 or PRO4978, useful in chrogene mapping, in generating antisense RNA and DNA, and in gene of the secretary secretary and the secretary s
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gerritsen

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     δ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     CC useful in the development and screening of therapeutically useful
CC reagents. The PRO polypeptides or antibodies are used in preparing a
CC medicament for treating a condition responsive to the polypeptides or
CC antibodies, such as tumours, for stimulating and inhibiting proliferation
CC glucose or FRA by skeletal muscle cells, for modulating the uptake of
CC glucose or FRA by skeletal muscle cells, for stimulating
CC proliferation of or gene expression in pericyte cells, for stimulating
CC proliferation of inner ear utricular supporting cells or T-lymphocyte
CC cells, for inducing endothelial cell tube formation and for treating
CC various bone and/or cartilage disorders such as sports injuries and
CC articular cartilage are useful for treating sports-related joint problems,
CC articular cartilage defects, osteoarthritis and rheumatoid arthritis. PRO
CC polypeptides are also useful for treating various mammalian haemoglobin-
CC may benefit from enhanced local immune system cell infiltration. Note: The
CC sequence data for this patent is also available in electronic format from
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Query Match

9., PRO tumors. nucleic acid, useful for preparing þ composition for treating

Claim 12; Fig 144; 660pp; English.

The invention relates to isolated human PRO polypeptides (secreted and CC transmembrane polypeptides) and the polynucleotides encoding them. The CC invention also relates to an antibody which specifically binds to a PRO CC polypeptide, a method for stimulating the release of tumour necrosis CC factor-alpha (TNF-alpha) from human blood, a method for stimulating the color, and a method for color, breast, cc proliferation or differentiation of chondrocyte cells and a method for CC prostate, rectal, cervical and liver tumours). The polynucleotides are CC useful in molecular biology, including uses as hybridisation probes, in clore the color, breast, in color, and sense and in color, and color, breast, in color, and color, breast, in color, and color, and in color, and in color, and color
